```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

modified polylinker; Site_1: EcoR I; Site_2: Not I;
UI-E-E01 is a normalized cDAA library containing the
following tissue(8): fetal eye. The library was
constructed according to Bonaldo, Lennon and Soares,
Genome Research, 6:791-806, 1996. First strand cDAA
synthesis was primed with an oligo-dT primer containing a
Not I site. Double stranded cDAA was ligated to an EcoR I
adaptor, digested with Not I, and cloned directionally
into pT7T3-Pac vector. The oligonucleotide used to prime
the synthesis of first-strand cDAA contains a library tag
sequence that is located between the Not I site and the
(dT):8 tail. The sequence tag for this library is
CGGGTATACC. This library was created for the program, Gene
Discovery in the Visual System, supported by National Eye
Institute (NEI):

ECORI; Site 2: ECORI; Female C57BL/6J mouse kidney and/or brain genomic DNA was isolated and partially digested with a combination of EcoRI and ECORI Methylase. Size selected DNA was cloned into the pBACG3.6 vector at the ECORI sites. The ligation products were transformed into DH10B electrocompetent cells (BRL Life Technologies). "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Carninci, P., Shibata, Y., Hayatsu, N., Sugahara, Y., Shibata, K., Itoh, M., Komo, H., Okazaki, Y., Muramatsu, M. and Hayashizaki, Y. Fore 1: Site 2: EcoR1; Female C57BL/67 mouse kidney and/or
Broni Site 3: EcoR1; Female C57BL/67 mouse kidney and/or
Brain genomic DNA was isolated and partially digested
with a combination of EcoR1 and EcoR1 Methylase. Size
selected DNA was cloned into the pBACe3.6 vector at the
ECOR1 sites. The ligation products were transformed into
DH10B electrocompetent cells (BRL Life Technologies). "

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                             à
                                                          The present sequence represents a nucleic acid sequence that is used as a reference sequence to exemplify the method of the invention. The specification describes a method for the biological preparation of a stably encapsulated reference nucleic acid for molecular diagnostic and genetic testing. The method comprises inserting a vector containing a reference nucleic acid into a cell through its lipoprotein outer membrane to encapsulate the nucleic acid, multiplying the cell to propagate the nucleic acid, multiplying the cell to propagate the and achieving a desired stability of the cell membrane for substantially matching the nucleic acid with the membrane stability of test cells. The reference nucleic acid with the membrane stability of test cells. The

The present invention relates to hereditary hemochromatosis gene products. These proteins may be used to treat a patient diagnosed as having human hemochromatosis disease. It is also useful as a metal chelation agent or as a T-cell differentiation factor, and for alleviating iron overload. They may also be used in protein replacement therapy for individuals having a defective human hemochromatosis gene.
                                                                                                                                                                                                                                                                                                      Wolff RK;

(I) is useful for reducing intracellular iron absorption in patients having hereditary haemochromatosis, transfusions,
                                                                9
                                                                                                                                                                                                                                                                                                                                                                                  iron absorption regulator; intracellular iron absorption; lung injury; haemochromatosis; transfusion; thalassaemia; haemolytic anaemia; chronic infection; transferrin receptor; TfR; brain tumour; cancer; oxidative stress disorder; itssue damage; vascular disease; inflammation; atheroscierosis; autoimmune disease; inflammatory condition; gene; ss.

thalassaemias, haemolytic anaemia or chronic infections, and for delivering a therapeutic to cells that over-express transferrin receptor (TER) which are preferably lymphocytes or leukocytes, across the bloodbrain barrier. (I) is further useful for treating brain tumour. (I) is also useful for treating oxidative stress disorders resulting in tissue damage e.g. vascular diseases, inflammation, atherosclerosis, cum injury, isofaemia, etc. A DNA molecule (II) encoding (I) is useful as a platform for drug delivery of therapeutic use for cancer, autoimmune diseases and inflammatory conditions. The monochain manifests specific characteristics advantageous for drug delivery systems. It is a coupuble, stable and fully conformed protein. It binds specifically to transferrin receptor (TER) and therefore targets cells that over-express this receptor. It is continuously internalised by the target cells, thus cells, minimising side effects. It dissociates from the receptor in the cells, minimising side effects. It megatively regulates iron absorption. It is not diluted in the blood as is transferrin. It should not induce an immune response since it is a self non-polymeric protein and delivery of drugs via monochain is expected to overcome drug-resistance since it is a continuous of herear in the present sequence represents the continuous of herear monochain sequence represents the
